Abstracts

Thermally conductive gel is a two-component preformed thermally conductive silicone grease material, which mainly meets the requirements of low pressure and high compressive modulus when the product is in use. Low contact thermal resistance and good electrical insulation properties. This material has some advantages of thermal pad and thermal grease at the same time, and better makes up for the weaknesses of both.

Thermally conductive gel inherits the advantages of good affinity, weather resistance, high and low temperature resistance, and good insulation properties of silicone materials. At the same time, it has strong plasticity, which can meet the filling of uneven interfaces and meet the heat transfer needs of various applications. It has high thermal conductivity, low compression force application, low pressure, high compression ratio, high electrical insulation, good temperature resistance and new energy, and can realize automatic use and other properties.
