Thermocouple fixing glue is a special adhesive used to firmly bond thermocouples to the surface of the measured object. Its core function is to achieve reliable fixation of thermocouples and substrates through chemical bonding, while taking into account thermal conductivity and adaptability to extreme environments. This type of glue usually adopts a two-component system. After the main agent and curing agent are mixed, a cross-linking reaction occurs to form a high-strength bonding layer. The cured product must have high temperature resistance, vibration resistance, and chemical corrosion resistance to ensure long-term bonding strength in high temperatures (such as 1200?-1700?), high humidity or corrosive media. In addition, the thermal conductivity of the glue must match the thermocouple material to reduce the interface thermal resistance and ensure high-precision transmission of temperature signals.
