According to our (Global Info Research) latest study, the global Thermocouple market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

A thermocouple is a temperature sensor used to measure temperature in various applications. It consists of two different metal wires or alloys, known as thermocouple wires, joined at one end to form a sensing junction. When there is a temperature difference between the two junctions (the sensing junction and the reference junction), it generates a small voltage known as the thermoelectric voltage. By measuring this voltage, the temperature at the sensing junction can be determined.

Thermocouples are widely used in industries such as manufacturing, automotive, aerospace, and scientific research, where precise and accurate temperature measurements are essential for process control, quality assurance, and research purposes. They are available in various types, each with specific temperature ranges and applications.
