Thermocouple wire welding machine is a special equipment for welding thermocouple bimetallic wires. Its core function is to achieve efficient connection between thermocouple wires and metal substrates or wires by precisely controlling welding parameters. Its working principle is based on capacitor energy storage resistance welding technology. It uses capacitors to store electricity and then instantly release large currents, so that the overlapping points of thermocouple wires fuse under local thermal effects to form reliable welding nodes. This equipment usually has multi-specification welding capabilities and can handle metal wires with wire diameters of #16 to #30 (0.255mm~1.291mm), and is compatible with common thermocouple wires such as J, K, and E types. The welding process does not require complex fixtures or surface pretreatment. It is easy to operate and the welds are smooth without arc noise.
