## Abstracts

The global Thermoelectric Separation Power Battery market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Thermoelectric separation of power batteries is a technology that can improve battery performance and extend battery life. In power batteries, uneven temperature distribution inside the battery will lead to reduced battery performance and shortened life. Therefore, this problem can be effectively solved through thermoelectric separation technology. The basic principle of power battery thermoelectric separation technology is to monitor the temperature distribution inside the battery in real time by placing a thermocouple inside the battery, and take corresponding measures based on the temperature distribution. When the internal temperature of the battery is too high, the thermocouple will immediately transmit the temperature signal to the battery management system, and the system will take timely measures to reduce the battery temperature. This technology can effectively control the temperature of the battery and improve the performance and life of the battery.
