According to our (Global Info Research) latest study, the global Thermoluminescence Dosimeter market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

A thermoluminescent dosimeter is a device that uses the principle of thermoluminescence to record the cumulative radiation dose. The thermoluminescent dosimeter heats the dosimeter receiving the radiation and measures the thermoluminescent output with a photomultiplier tube to read the radiation dose value. The advantage is that the readings decay very little even after a long time of storage. In addition, film badges of various shapes can be made for personal dose monitoring.
