Abstracts

The global Thermoluminescence Dosimeter market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A thermoluminescent dosimeter is a device that uses the principle of thermoluminescence to record the cumulative radiation dose. The thermoluminescent dosimeter heats the dosimeter receiving the radiation and measures the thermoluminescent output with a photomultiplier tube to read the radiation dose value. The advantage is that the readings decay very little even after a long time of storage. In addition, film badges of various shapes can be made for personal dose monitoring.

This report studies the global Thermoluminescence Dosimeter production, demand, key manufacturers, and key regions.
