Abstracts

The global Thermophysical Property Parameter Testing System market size is expected to reach \$ 265 million by 2032, rising at a market growth of 6.4% CAGR during the forecast period (2026-2032).

In 2025, global sales of Thermophysical Property Parameter Testing System reached approximately 1,200–1,700 units, with an average market price of about USD 120000 unit, an annual production capacity of roughly 1,500–1,900 units, and an industry-average gross margin of approximately 20%.

Thermophysical Property Parameter Testing Systems are specialized instrument platforms used to quantitatively measure, calculate, and analyze the thermal physical properties of materials for research and development, quality control, process validation, and engineering thermal design. A typical system integrates a heat source or laser/pulsed light source, temperature sensing unit, sample holder, furnace or environmental chamber, data acquisition module, inverse calculation algorithm, and analysis software. These systems are used for bulk solids, powders, liquids, pastes, films, coatings, porous materials, composites, insulation materials, electronic packaging materials, and materials tested under high-temperature, low-temperature, vacuum, or controlled-atmosphere conditions. Key output parameters include thermal conductivity, thermal diffusivity, specific heat capacity, volumetric heat capacity, thermal effusivity, coefficient of thermal expansion, thermal resistance, heat flow response, and interfacial thermal resistance. This research focuses on complete instruments, measurement platforms, and dedicated systems for material-level and sample-level thermophysical parameter testing, covering mainstream methods such as laser flash analysis, transient plane source, modified transient plane source, transient hot wire, heat flow meter,

guarded hot plate, thermomechanical analysis, calorimetry, and thin-film thermorefectance.
