Abstracts

According to our (Global Info Research) latest study, the global Thick Film Ceramic Substrates market size was valued at USD 102.9 million in 2023 and is forecast to a readjusted size of USD 132.1 million by 2030 with a CAGR of 3.6% during review period.

Thick film ceramic substrate refers to ceramic substrate processed by thick film technology. The thick film ceramic substrate is a post-fired ceramic substrate. 'Thick Film' refers to the thickness of conductor layer on Ceramic Substrate. Normally the thickness will be at least exceeds 10 micron (μm), around 10~100 μm , more thick than sputtering technology in Thin Film Ceramic Substrate. Of course thickness is less than DCB Ceramic board or FR4 board.

At the same time, using thick film technology, we can put resistor, electric capacity, conductor, semi-conductor, and interchangeable conductor on ceramic board, after manufacturing steps of printing and high temperature sintering. We can make all the resistors with the same value, or different value for different resistor on the same board.

Due to the mature technology, simple process and low cost, thick-film ceramic substrates have been applied in electronic packages that do not require high graphics accuracy.

In general, the thick film ceramic substrate covers Alumina (Al_2O_3) thick film substrates, AlN thick film substrates and BeO thick film Substrates.

Global thick film ceramic substrates key players include Noritake, NCI, Miyoshi

Electronics Corporation, etc. Global top 3 manufacturers hold a share over 27%.

Asia-Pacific is the largest market, with a share about 37%, followed by North America and Europe, both have a share about 56 percent.
