Abstracts

The global Thick Milk market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Thick milk is a milk product made using low-temperature membrane separation technology. It is a specialty milk category made from 100% raw milk, which is filtered to extract the concentrated milk base, and then compounded with other milk ingredients such as milk fat, milk protein, lactose, milk mineral salts, etc. The application of this technology allows the molecules such as milk fat, milk protein, lactose, and milk mineral salts in milk to be separated and purified, so that the final thick milk has higher nutritional indicators, a richer flavor, and a more mellow texture. . Thick cow's milk was originally produced in this way, but now there are similar products on the market made using cow's milk powder and other additives. These products are lower cost and relatively cheap. Nonetheless, since they may not be comparable in taste to real thick cow's milk and may not have as much nutritional value as the real thing, they are not recommended as a regular dietary choice. However, for those who pursue taste, it is acceptable to enjoy thick milk occasionally. In addition, thick milk is also used to prepare various drinks such as coffee and milk tea to enhance the flavor and value of the drinks.
