Abstracts

Thin film gain flattening filter is composed of a dielectric thin film, and its basic structure is a resonator based on a Fabry-Polo etalon, which is a flat plate with a fixed spacing, composed of a cavity and a mirror. The production process of GFF based on thin-film filtering technology is relatively complex, and its adaptability to the new amplifier gain curve is weak. At the same time, thin-film filtering GFF belongs to a body-effect technology with relatively large insertion loss.

According to our (Global Info Research) latest study, the global Thin Film Gain Flattening Filter market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.
