According to our (Global Info Research) latest study, the global Thin Layer Chromatograph market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Thin Layer Chromatography (TLC) is a chromatographic technique used to separate non-volatile mixtures. The process is carried out on a TLC plate, which is a flat, inert substrate coated with a thin layer of adsorbent material, typically silica gel or alumina. This layer acts as the stationary phase. A sample is applied onto the plate, and a solvent or solvent mixture, known as the mobile phase, moves up the plate via capillary action. Different compounds in the sample mixture travel at different rates due to their varying affinities for the stationary phase versus the mobile phase, resulting in separation.
