Abstracts

According to our (Global Info Research) latest study, the global Three-Dimensional Topological Insulator market size was valued at USD 1 million in 2022 and is forecast to a readjusted size of USD 1 million by 2029 with a CAGR of 9.4% during review period.

Topological insulators are a popular field in condensed matter research. The body of this material is insulated like the insulators commonly known to people, but there are always conductive edge states at its boundaries or surfaces. This is its most unique property that distinguishes it from ordinary insulators. A topological insulator is a material that behaves as an electrical insulator internally and as an electrical conductor on the surface. This means that electrons can only move along the surface of the material. In more technical terms, a topological insulator is an insulator that cannot adiabatically transform into a regular insulator without passing through an intermediate conducting state.

Topological insulators are an emerging quantum material, and their research and discovery benefit from technological progress. The continuous development of science and technology provides more opportunities and possibilities for the preparation, property research and application of topological insulators.

Understanding and exploring new materials and physical phenomena has always been the driving force for scientific research. As a material with unique electronic band structure and properties, topological insulators provide new challenges and opportunities, attracting many researchers to conduct in-depth research.

In addition to low-energy consumption, high-performance electronic devices, there is

also a growing demand for the development of new devices in other fields. For example, Enterprise R&S Department, thermoelectric materials, energy storage, etc. can all benefit from topological insulators. Therefore, the research and application of topological insulators have been further promoted, driven by the requirements and needs for realizing new types of devices.

In the field of information technology, people have an increasingly urgent need for higher-performance, lower-energy-consumption electronic devices. Topological insulators have special charge transport properties, such as electrons can only be transported along boundaries, thereby reducing current dissipation and energy consumption. This makes topological insulators potentially advantageous in developing low-energy electronic devices.
