According to our (Global Info Research) latest study, the global Three-pass Gas Boiler market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

A three-pass gas boiler is a boiler that burns fuel such as natural gas or liquefied petroleum gas and generates steam or hot water through heat exchange. The "three-pass" of this type of boiler refers to the three cycles of hot gas inside the boiler.

The following is the basic working principle of a three-pass gas boiler:

First return pass (combustion return pass): Fuel (such as natural gas or liquefied petroleum gas) is burned in the combustion chamber of the boiler to produce high-temperature combustion gases. The flame and hot gas formed by these combustion gases in the combustion chamber pass through the first return pass in the boiler, which is the first circulation of hot gas.

Second return pass (convection return pass): The hot gas passes through the smoke tube or tube bundle of the boiler and transfers heat to the water on the inner wall of the smoke tube and the surface of the tube bundle. This is done by convective heat transfer, with the hot gas losing some of its heat on this return journey, while the water is heated and converted to steam or to provide hot water. This is the second cycle of hot gas.

The third return pass (radiation return): After the hot gas passes through the smoke tube, there is still some residual heat. In the third return pass, this waste heat is

transferred to water or steam by radiation, so that the last part of the heat is effectively used. This is the third cycle of hot gas.

Through this three-pass design, the three-pass gas boiler can more fully utilize the thermal energy of the fuel and improve energy utilization efficiency. The design of the radiant return can effectively reduce the unused heat in the flue gas, making the overall performance of the boiler more superior.

This type of boiler is typically used in heating systems or industrial processes to provide steam or hot water for heating buildings, supplying hot water, or driving industrial processes.
