## Abstracts

Three-phase filter capacitor is an electrical component used in power systems to filter out unwanted noise and harmonics from three-phase AC voltage lines. It consists of three individual capacitors, each connected between a phase and ground, forming a Y configuration. These capacitors help improve power quality by reducing voltage spikes and suppressing electromagnetic interference, thus enhancing the efficiency and reliability of electrical equipment.

According to our (Global Info Research) latest study, the global Three-Phase Filter Capacitor market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.

The industry trend for three-phase filter capacitors is marked by a steady rise in demand driven by several key factors. Firstly, there's a growing emphasis on power quality improvement across various sectors, including industrial, commercial, and residential applications, spurred by the increasing reliance on sensitive electronic equipment. Additionally, the transition towards renewable energy sources like wind and solar power necessitates effective harmonic mitigation and noise suppression, boosting the adoption of filter capacitors in power generation and distribution systems. Moreover, the expansion of electric vehicle infrastructure and the proliferation of telecommunications networks further contribute to the rising demand for reliable and efficient three-phase filter capacitors, shaping a promising trajectory for the market.
