According to our (Global Info Research) latest study, the global Three-Phase Metering Chip market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The three-phase metering chip is an integrated circuit chip used for power metering. It is usually used in three-phase power systems to measure and record the consumption of electrical energy. Compared with single-phase metering chips, three-phase metering chips have higher complexity and functions and can measure and calculate power data of three phases simultaneously. The main features and functions of the three-phase metering chip include: Three-phase current measurement: It can measure and record the current of three phases at the same time to accurately measure the consumption of electrical energy. Three-phase voltage measurement: Able to measure and record the voltage of three phases simultaneously to calculate the power factor and power of electrical energy. Power calculation: Able to calculate the active power, reactive power and apparent power of three-phase electric energy based on measured current and voltage data. Electric energy measurement: It can accurately measure and record the consumption of three-phase electric energy, including active electric energy, reactive energy and apparent electric energy. Communication interface: Usually has a communication interface that can transmit data with external systems or networks to achieve remote meter reading and energy management.
