Abstracts

According to our (Global Info Research) latest study, the global Three Plate Injection Molding Machine market size was valued at US\$ 2884 million in 2025 and is forecast to a readjusted size of US\$ 3978 million by 2032 with a CAGR of 4.7% during review period.

In 2025, global Three Plate Injection Molding Machine production reached approximately 10.6k units, with an average global market price of around US\$265k per unit.

A ?three-plate injection molding machine? typically refers to an injection molding machine and control setup used with a 3-plate mold. The 3-plate mold opens in stages so the part and runner separate automatically (automatic degating), enabling more flexible gate locations (e.g., pinpoint/multi-gate layouts) and less post-trim work?often for appearance parts, thin-wall parts, or multi-cavity production. On the machine side, the core units (clamping, injection/plasticizing, ejection) are similar to standard machines, but staged opening stroke control, motion profiles, platen rigidity/accuracy, and cycle synchronization with automation become more critical.

Upstream covers electromechanical subsystems and materials: structural frames (castings/weldments, tie bars/guides), injection unit (screw & barrel, heaters, nozzle), hydraulics and sealing (pumps/valves/cylinders/seals), controls (servo drives, PLC/motion control, sensors), plus capabilities that matter more for 3-plate molds such as staged mold-opening motion control/feedback, mold protection, and automation/robot interfacing. Representative suppliers include Bosch Rexroth (industrial hydraulics/drive ecosystems) and Siemens (industrial automation and drives). Downstream includes

mold makers, injection molders, and end-use industries; 3-plate molds are common in packaging/personal care, consumer electronics housings, appliance appearance parts, medical disposables, and automotive trim parts where automatic degating and good cosmetics help high-volume automation.

Demand for injection machines used with 3-plate molds generally follows the injection molding cycle and end-market upgrading, with an increasing focus on throughput + cosmetics + automation. Because 3-plate molds enable automatic degating and flexible gate placement, they can improve cosmetic consistency, reduce manual trimming, and support stable robotic cycles?valuable in multi-cavity, thin-wall, and consumer/appearance production. At the same time, hot runners/valve gates can substitute 3-plate cold-runner approaches in certain high-end applications, pushing buyers to optimize across mold strategy (cold vs hot runner), machine capabilities (high-speed injection, repeatability, staged opening control), and line automation. Tailwinds include packaging/consumer demand, faster refresh cycles for electronics/appliance housings, rising labor costs driving automation, and stricter cosmetic requirements; headwinds include capex delays during down cycles, price pressure from commoditized models, and substitution by advanced gating systems. Overall, suppliers with strong process-mold-automation integration tend to win premium projects.
