Abstracts

In electrical engineering, a disconnect, disconnect switch or isolator switch is used to ensure that an electrical circuit is completely de-energized for service or maintenance. Such switches are often found in electrical distribution and industrial applications, where machinery must have its source of driving power removed for adjustment or repair. High voltage isolation switches are used in electrical substations to allow isolation of apparatus such as circuit breakers, transformers, and transmission lines. For maintenance, the disconnect is usually not intended for normal control of the circuit, but only for safety isolation. Disconnectors can be manual or motor operated.
