Abstracts

According to our (Global Info Research) latest study, the global Three-state Output D-type Latch market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

The three-state output D-type latch is a digital circuit element that can store an input value and output the stored value under the action of a clock signal. Different from the conventional D-type latch, the output of the three-state output D-type latch has three states: high level, low level, and high impedance state.

The three-state output D-type latch usually consists of a D flip-flop and an output buffer. D flip-flops are used to store input values, while output buffers are used to control the output state. Three-state output D-type latches are useful when multiple devices need to share a bus or output. By controlling the enable signal of the output buffer, multiple latches can be serially connected on the same bus, and only one latch output is valid at a time. This can effectively avoid level conflicts and data corruption problems caused by simultaneous output of multiple latches.

This report is a detailed and comprehensive analysis for global Three-state Output D-type Latch market. Both quantitative and qualitative analyses are presented by manufacturers, by region & country, by Type and by Application.
