## Abstracts

The global Three-way Airplane Solenoid Valve market size is expected to reach \$ 52 million by 2029, rising at a market growth of 1.1% CAGR during the forecast period (2023-2029).

A three-way airplane solenoid valve is an electrically operated valve that controls the flow of air or other fluids in an airplane's pneumatic system. It has three ports - an inlet port, an exhaust port, and a control port - and is typically used to control the direction of airflow in a pneumatic system.

When the valve is energized, the solenoid coil creates a magnetic field that pulls a plunger or armature inside the valve, allowing air or fluid to flow from the inlet port to the control port. This opens the airflow path to the system being controlled. At the same time, the exhaust port is closed. When the valve is de-energized, the plunger or armature returns to its original position, blocking the flow of air or fluid from the inlet port to the control port and opening the exhaust port. This vents the air or fluid from the system being controlled.

This report studies the global Three-way Airplane Solenoid Valve production, demand, key manufacturers, and key regions.
