## Abstracts

According to our (Global Info Research) latest study, the global Through Glass Via (TGV) Foundry Service market size was valued at US\$ 376 million in 2024 and is forecast to a readjusted size of USD 1231 million by 2031 with a CAGR of 18.4% during review period.

Through-glass via (TGV) foundry refers to the process of making tiny vertical through holes (usually with a diameter of 10? $\mu$ m~100? $\mu$ m) on high-quality borosilicate glass or quartz glass substrates through a series of high-precision processes, and filling these through holes with conductive materials (such as copper) to achieve electrical connections. This technology uses laser etching, inductively coupled plasma dry etching and other methods to prepare through holes. It has the advantages of excellent high-frequency electrical properties, strong mechanical stability, low cost, and simple process flow. It has broad application prospects in the fields of precision devices such as Mini/Micro LED direct display and semiconductor advanced packaging substrates.
