Abstracts

The global Through Hole Mount Aluminum Electrolytic Capacitors market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Through-hole mount aluminum electrolytic capacitors are electronic components that are often used in electronic equipment. Unlike surface-mount aluminum electrolytic capacitors, the leads of through-hole mount aluminum electrolytic capacitors are drawn out through metal holes (ie, through holes) at the bottom of the capacitor, and are mounted by inserting into holes on the circuit board. The structure of the through-hole mount type aluminum electrolytic capacitor is similar to that of the surface mount type, using aluminum foil as the electrode, which has the advantages of high capacitance, low ESR (Equivalent Series Resistance) and a high operating temperature range. Different from the surface mount type, the through-hole mount capacitor has a larger size, generally between 5mm and 25mm in diameter, and is suitable for traditional circuit board manufacturing processes such as manual soldering or wave soldering. The capacity of through-hole mounted aluminum electrolytic capacitors generally ranges from a few microfarads (μ F) to several thousand microfarads (mF), and the voltage level generally ranges from a few volts (V) to hundreds of volts (V). Different types of capacitors need to be selected. Due to the convenience of installation, stability and reliability, through-hole mounting aluminum electrolytic capacitors are still widely used in some electronic devices that require high quality capacitors.
