The global Through Hole Wirewound Resistors market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A through-hole wirewound resistor is a type of resistor characterized by a through-hole structure formed by winding a resistive material around an insulating material with good electrical conductivity. The resistance value of the resistor is adjusted by factors such as the number of turns of the winding, the diameter of the wire, and the material. Through-hole wirewound resistors usually have an insulating material as a supporting structure, and the resistive material is wound on the insulating material by winding or printing techniques to form one or more winding rings. The winding rings are connected through connectors or through holes to form a circuit of resistors.
