Abstracts

The global Thrust Spherical Roller Bearing market size is expected to reach \$ 6655 million by 2032, rising at a market growth of 6.2% CAGR during the forecast period (2026-2032).

Global sales of thrust spherical roller bearings reached 16.94 million units in 2025, with an average price of \$253 per unit.

Thrust spherical roller bearings are separable thrust bearings with spherical outer ring raceways and asymmetrical spherical rollers at an angle to the bearing axis. They can simultaneously withstand large unidirectional axial loads and radial loads not exceeding 55% of the axial load, and automatically compensate for 2° of installation misalignment or shaft deflection.

The raw materials for thrust self-aligning roller bearings are primarily high-purity, high-chromium bearing steel (GCr15 or long-life steels such as SHX and Z steel). The raceways and rollers generally use vacuum degassed and electroslag remelted bar stock. Cages are categorized by size into stamped steel (?292 series) and solid brass (?293/294 series). For extra-large sizes or impact applications, carburized forged steel may be used. Overall, raw material costs account for 55-60% of the ex-factory price. In the cost structure, bearing steel bar stock/forgings account for the highest proportion, approximately 40%, while cages and rolling elements together account for 10-15%. Machining, heat treatment, surface coating (such as TDC), and testing costs account for 25-30%. Because high-end steel and copper cages still rely on imports, there is little room for negotiation on core components, and raw material costs consistently account for around 90% of the total bill of materials (BOM).
