Abstracts

Thymosin beta-4 is the most prevalent of the cytoplasmic G-actin binding proteins belonging to the highly conserved thymosin beta family. Known to bind actin monomers, Thymosin beta-4 sequesters G-actin in a manner that prevents actin polymerization. Thymosin beta-4 plays several important roles including induction of tissue remodeling, wound healing in both cell and tissue injuries, and cell differentiation via mechanisms that have yet to be fully elucidated. It is involved in the regulation of the cytoskeleton, and thereby influences an array of cellular processes. Within the brain, Thymosin beta-4 is associated with the neurite extension and migration of neurons. Expression has been observed in various hemopoietic and lymphoid malignant cell lines.

According to our (Global Info Research) latest study, the global Thymosin Beta 4 Antibody market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.
