Abstracts

The global Tiamulinfumarate market size is expected to reach \$ 138.6 million by 2029, rising at a market growth of 4.7% CAGR during the forecast period (2023-2029).

The Tiamulin Fumarate market is driven by its effectiveness in treating bacterial infections in livestock and poultry, enhancing animal health and productivity. Tiamulin Fumarate is widely used for respiratory and enteric disease management. However, a significant challenge in this market is the growing concern over antibiotic resistance, leading to stricter regulations on antibiotic use in animal agriculture. Compliance with these regulations and the need for responsible antibiotic usage is a challenge for manufacturers. Additionally, competition from alternative treatments and the cost considerations of antibiotic alternatives require manufacturers to strike a balance between affordability and maintaining product quality, all while addressing evolving industry and regulatory demands.

Tiamulin hydrogen fumarate is a semisynthetic derivative of pleuromutilin. Tiamulin is active against gram-positive bacteria, mycoplasmas, and anaerobes, including *Brachyspira hyodysenteriae*. Tiamulin is well absorbed when administered PO. It is labeled for use as an oral medicated feed or water in swine in the US to treat swine dysentery and *Actinobacillus pleuropneumoniae*. In poultry, tiamulin interferes with monensin and salinomycin metabolism, and if the drugs are administered together, they become toxic. Generally, however, tiamulin has few adverse effects.
