Abstracts

The global Tibial Implant market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A standard tibial implant consists of two main parts: the tray and the stem. The proximal portion of the tibial implant is the tray, which forms an articulated interface with the femoral component. Typically, the tray holds a liner made of a compliant material such as polyethylene, which provides a smooth surface for articulation with the femoral component. The distal portion of the tibial implant forms a stem designed to extend down into the tibia into which the component is implanted. In order to provide for normal anatomical movement of the knee implant, the tibial implant must be held firmly in place to prevent further movement of the implant down into the bone and also prevent rotation of position within the bone.

This report studies the global Tibial Implant production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Tibial Implant, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
