The global Tibial Intramedullary Nail market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The tibia is a long tubular bone in the human body. Its anatomical feature is that the bone marrow cavity is wide, and the upper and lower ends are articular surfaces. For tibial fractures, intramedullary nailing can be used for treatment. The advantage is that the trauma is small and does not interfere with the fracture end, which is conducive to protecting the blood supply of the broken end, thereby facilitating the healing of the fracture, and minimizing the complications and sequelae caused by trauma.
