Tin plated copper conductors are divided into two types: one is plated first and then twisted, and the other is twisted first and then tin plated. Tin plated stranded wire is beneficial for the flexibility of the wire, while tin plated stranded wire is the opposite, with higher hardness and suitable for cables used for special connections. Tin can form a tin oxide film in air to prevent further oxidation, and tin and halogens can also form a thin film like effect. It has good corrosion resistance, as well as certain strength and toughness. Tin also has the function of preventing conductor wear when connecting electrical instruments, making it easy to weld or pierce.
