Abstracts

The global Tire Pyrolysis Equipment market size is expected to reach \$ 338.1 million by 2029, rising at a market growth of 28.4% CAGR during the forecast period (2023-2029).

Car tires are usually made of natural rubber, synthetic rubber, steel cord, and carbon black for strength and durability. After being discarded, the sturdiness of these tires has brought troubles to environmental protection. It is difficult for these tires to be degraded naturally by ordinary landfill methods, and once the piled up tires are ignited, not only will there be a fire but also damage the environment. The environment produces huge pollution. The tire pyrolysis equipment can keep working 24 hours a day, with high efficiency and high production capacity. The slag can be discharged without waiting for the reactor to cool down, saving time and fuel for preheating the reactor. Tire pyrolysis equipment turns waste tires into usable resources, greatly reducing environmental pollution and improving resource utilization. Tire pyrolysis equipment is divided into intermittent pyrolysis equipment and continuous pyrolysis equipment.

This report studies the global Tire Pyrolysis Equipment production, demand, key manufacturers, and key regions.
