## Abstracts

The global Titanium Artificial Dental Implants market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Artificial dental implants are not really planted with natural teeth, but through medical methods, the pure titanium metal with high compatibility with human bone is precisely designed and manufactured into a cylinder or other shape similar to the root of a tooth. It is implanted in the alveolar bone of the edentulous area by surgical method. After 1 to 3 months, when the artificial tooth root is in close contact with the alveolar bone, a porcelain crown is made on the artificial tooth root. Dental implants can achieve restoration results that are very similar to natural teeth in function, structure and aesthetics, and have become the preferred restoration method for more and more edentulous patients. Because it is not destructive, dental implants have been recognized by the dental community as the preferred method of restoration of missing teeth.

This report studies the global Titanium Artificial Dental Implants production, demand, key manufacturers, and key regions.
