Abstracts

According to our (Global Info Research) latest study, the global Titanium Chloride market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Titanium (II) chloride is a chemical compound with the formula $TiCl_2$. It is a black solid that has been studied only moderately, probably because of its high reactivity. $Ti(II)$ is a strong reducing agent: it has a high affinity for oxygen and reacts irreversibly with water to produce H_2 . Titanium has exceptional corrosion resistance to neutral chloride solutions even at comparatively high temperatures. The metal usually has very low corrosion rates in chloride surroundings. Crevice corrosion appears to be the restrictive factor for the application of titanium and its alloys in aqueous chloride environments.
