Titanium dioxide for denitrification is a key material used in selective catalytic reduction technology. Its main component is anatase or rutile titanium dioxide (TiO₂), which has a large specific surface area and excellent catalytic performance, and is often used as a catalyst carrier or active component. By combining with metal oxides such as vanadium and tungsten, titanium dioxide for denitrification can effectively promote the reaction of nitrogen oxides (NO_x) with reducing agents (such as NH₃), converting NO_x into harmless nitrogen (N₂) and water (H₂O), and is widely used in thermal power plants, industrial kilns, steel chemicals, and diesel exhaust treatment.
