Abstracts

The global Titanium Tube Heat Exchanger market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The titanium tube heat exchanger is made of high-quality titanium tubes, and the titanium tubes used conform to the national standard GB/T3625-2007, the American standard ASTM B338 (refer to the domestic and foreign standards of titanium and titanium alloy tubes for titanium heat exchangers and titanium condensers GB/T3625 and ASTM B338). In terms of physical properties, titanium tubes have many advantages such as light weight and superior mechanical properties. Titanium has high strength, and the tensile strength of pure titanium can reach up to 180kg/mm². Some steels are stronger than titanium alloys, but the specific strength (the ratio of tensile strength to density) of titanium alloys exceeds that of high-quality steel. In addition, titanium alloys have good heat resistance strength, low temperature toughness and fracture toughness.

The titanium tube heat exchanger is a heat exchange device made of high-quality titanium tubes that transfers part of the heat of the hot fluid to the cold fluid. Due to the many advantages of industrial pure titanium, titanium heat exchanger is a general-purpose equipment in chemical industry, petroleum, power, food and many other industrial sectors, and plays an important role in production. In practical application, the heat exchange effect of the heat exchanger has a great relationship with the material and process characteristics of the heat exchanger. During the concentration process of materials, solutes or impurities are often deposited on the heating surface, precipitated and crystallized to form a scale layer, which affects heat transfer; some solutes are heat-sensitive, and they are easily deteriorated if they stay at high temperature for too long; some materials are highly corrosive or higher viscosity etc.
