Abstracts

According to our (Global Info Research) latest study, the global TMR Magnetic ICs market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

TMR Magnetic ICs is an integrated circuit that uses the tunnel magnetoresistance effect to detect changes in magnetic fields. TMR sensors are composed of two layers of magnetic films and one layer of non-magnetic film. When an external magnetic field acts on the sensor, it causes the magnetization direction of the magnetic film to change, thereby changing the current flowing through the non-magnetic film, causing resistance changes. By measuring this resistance change, the magnetic field can be detected. Due to its high sensitivity, low power consumption and good temperature stability, TMR sensors have gradually replaced traditional Hall effect and AMR sensors in many fields and have become an important development direction of modern magnetic induction technology. Therefore, TMR Magnetic ICs have also become important.
