TOFD testing equipment is an advanced non-destructive testing technology equipment based on the principle of ultrasonic diffraction. It transmits and receives ultrasonic signals, uses the diffraction phenomenon caused by defects when the beam propagates in the material, and accurately determines the location, size and nature of the defects by accurately measuring the arrival time difference of the diffracted waves. The equipment is usually composed of core components such as transmitting probes, receiving probes, signal processors, and displays. It has the characteristics of high detection accuracy, strong penetration ability, and a wide range of applications. It can effectively detect cracks, inclusions, corrosion and other defects inside and on the surface of various materials such as metals and non-metals. It is widely used in structural integrity assessment, quality control and safety monitoring in the fields of aerospace, petrochemicals, nuclear power, transportation, construction, etc., providing strong technical support for improving product safety and reliability.
