Topical antibiotics for acne are medications applied directly to the skin to treat mild to moderate inflammatory acne. They work by reducing the population of Cutibacterium acnes and controlling inflammation, thereby improving papules and pustules. Common topical antibiotics include clindamycin, erythromycin, and fusidic acid, typically formulated as gels, solutions, or creams. To minimize the risk of antibiotic resistance, these treatments are often combined with non-antibiotic agents such as benzoyl peroxide. Long-term monotherapy with antibiotics is discouraged, and good skincare practices like gentle cleansing and oil control are recommended during treatment.
