According to our (Global Info Research) latest study, the global Torque Calibration Arm market size was valued at US\$ 173 million in 2024 and is forecast to a readjusted size of USD 246 million by 2031 with a CAGR of 5.0% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

A torque calibration arm is a device used to calibrate torque - measuring tools, such as torque wrenches, torque sensors, and torque testers. Usually made of high - quality anodized aluminum, such as 6060 - T6 aluminum alloy, which has the characteristics of light weight, high strength, and good corrosion resistance, ensuring the accuracy and durability of the calibration arm. The length of the calibration arm has a very high dimensional accuracy, with a tolerance of generally ($\pm 0.0625\%$). This high - precision dimension ensures the accuracy of torque calibration. Different models of calibration arms have lengths ranging from 1 to 48 inches to meet the calibration needs of different torque - measuring equipment. It is usually equipped with a weight pan and a wire with loops on both sides. The weight pan is used to place standard weights, and the wire can be used to hang other certified hangers with slotted weights. In addition, there are also various drive adapters to adapt to different types of torque - measuring tools.
