Abstracts

The global Torque Sensor Calibration Services market size is expected to reach \$ 322 million by 2032, rising at a market growth of 5.1% CAGR during the forecast period (2026-2032).

To address the problems of decreased measurement accuracy, reduced data reliability, and difficulties in equipment performance verification caused by long-term load, mechanical wear, and environmental interference in torque sensors, professional torque sensor calibration services have emerged. Since the latter half of the 20th century, with the development of high-precision power transmission and automatic control systems, this service has evolved from basic static calibration to a systematic technical system encompassing static calibration, dynamic simulation, online calibration of rotating shafts, and temperature-torque composite compensation. Currently, torque sensor calibration services have formed a diversified service model including laboratory standard torque machine calibration, application of portable calibration devices in industrial sites, and fully automatic calibration systems. It is widely used in automotive manufacturing (such as engine and gearbox testing), wind turbine monitoring, aerospace propulsion system verification, industrial robot joint torque control, and quality inspection of precision assembly tools. By ensuring the accurate transmission and traceability of torque values, it provides indispensable technical support for product development, quality control, energy efficiency assessment, and safe operation.
