## Abstracts

According to our (Global Info Research) latest study, the global Torsion Tester market size was valued at USD 2081.9 million in 2023 and is forecast to a readjusted size of USD 2895.1 million by 2030 with a CAGR of 4.8% during review period.

Torsion Tester machines measure the torsional strength, stiffness, and stress-strain properties of materials and products. Torsional Test Systems are used to simulate real-life conditions and to check axial torsion properties through axial torque test of material specimens.

Torsion testing is a type of mechanical testing that evaluates the properties of materials or devices while under stress from angular displacement. Torsion testing can be split into two distinct categories: testing raw materials like metal wires or plastic tubing to determine properties such as shear strength and modulus, or functional testing of finished products subjected to torsion, such as screws, pharmaceutical bottles, and sheathed cables. The most common mechanical properties measured by torsion testing are modulus of elasticity in shear, yield shear strength, ultimate shear strength, modulus of rupture in shear, and ductility.
