Abstracts

The global Totally Implantable Central Venous Port Catheter market size is expected to reach \$ 5182 million by 2032, rising at a market growth of 9.0% CAGR during the forecast period (2026-2032).

In 2025, global output of totally implantable central venous port catheters reaches 8,600,000 units, with an average selling price of 320 USD per unit, total capacity of 10,200,000 units, and a gross margin of 58%.

A totally implantable central venous port catheter is a closed vascular access device implanted entirely beneath the skin and connected to a central vein. It typically consists of an implanted port reservoir and a flexible catheter, allowing repeated access via a special non-coring needle for infusion, drug delivery, chemotherapy, parenteral nutrition, and blood sampling. It offers lower infection risk, long service life, and improved patient comfort, and is widely used in oncology treatment, long-term infusion therapy, and chronic disease management.

Upstream mainly includes medical-grade silicone or polyurethane materials, titanium or polymer port body materials, injection molding and precision machining tools, as well as sterilization and packaging services. The midstream consists of the design, manufacturing, and quality control of port and catheter systems. Downstream applications are concentrated in hospital oncology, hematology, intensive care, and long-term infusion patients, with procurement typically conducted through hospital tenders or medical device distribution channels, where product safety, clinical validation, and supply reliability are critical requirements.
