The global Totally Implantable Venous Access Port (TIVAP) market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A Totally Implantable Venous Access Port (TIVAP) is a medical device designed for long-term intravenous (IV) therapy, providing a secure and convenient access point to the vascular system. Surgically implanted beneath the skin, usually in the chest area, the TIVAP consists of a reservoir and a catheter. The reservoir is accessed through the skin using a specialized needle, allowing healthcare professionals to administer medications, fluids, or draw blood without the need for repeated needle insertions. TIVAPs are commonly used in cancer treatment, chemotherapy, long-term antibiotic therapy, and other medical conditions requiring frequent or continuous intravenous interventions. This implantable device reduces the discomfort associated with repeated needle sticks and minimizes the risk of infection, providing a reliable and efficient means of delivering medical treatments directly into the bloodstream.
