Abstracts

The global Tower Crane Overload Limiter market size is expected to reach \$ 138 million by 2032, rising at a market growth of 3.0% CAGR during the forecast period (2026-2032).

A tower crane overload limiter is an essential safety mechanism specifically designed for tower cranes to safeguard against the dangerous condition of overloading. It operates by employing a variety of sensing technologies to accurately measure the actual load that the tower crane is lifting at any given moment. This device continuously monitors and compares the measured load with the pre-set rated capacity of the tower crane. When the load approaches or exceeds the safe limit, the overload limiter springs into action, typically by triggering audible and visual alarm signals to alert the operator. In more advanced systems, it can also automatically stop the crane's lifting or other related operations to prevent potential accidents and damage that could be caused by overloading. By doing so, the tower crane overload limiter plays a crucial role in ensuring the safety of the construction site, protecting the integrity of the tower crane itself, and safeguarding the lives and property of workers and those in the surrounding area.

In 2025, global Tower Crane Overload Limiter production reached approximately 55 K units, with an average global market price of around US\$ 1,970 per unit.

The upstream supply chain of Tower Crane Overload Limiters mainly includes load cells, angle sensors, radius or trolley-position sensors, height sensors, wind-speed sensors, microcontrollers, display panels, relays, cables, connectors, enclosures, electronic components, embedded software, and calibration tools. Midstream manufacturers integrate sensors, controllers, display terminals, alarm units, and cut-

off/interlock modules into a complete overload protection system. Downstream users are mainly tower crane OEMs, construction equipment rental companies, construction contractors, crane maintenance providers, infrastructure projects, real estate construction sites, ports, and industrial lifting applications. A tower crane overload limiter or load moment limiter usually monitors load weight, working radius, boom/jib angle, height, and operating status, then provides alarm or motion cut-off when the crane approaches unsafe working limits.

The cost structure of Tower Crane Overload Limiters is mainly composed of sensors, controller hardware, display and human-machine interface, alarm and relay output modules, wiring harnesses, waterproof enclosure, embedded software, calibration, testing, certification, assembly labor, installation support, packaging, logistics, and after-sales service. Sensors and controller/display modules usually account for the largest material cost, while software development, calibration accuracy, environmental protection grade, anti-interference design, compliance testing, and field commissioning also contribute significantly to total cost. High-end systems with multiple sensor channels, wireless communication, data logging, remote monitoring, and automatic cut-off functions generally have higher costs and selling prices.
