Abstracts

According to our (Global Info Research) latest study, the global Toxicological Testing of Cosmetics and Daily Chemical Products market size was valued at US\$ 2681 million in 2025 and is forecast to a readjusted size of US\$ 4373 million by 2032 with a CAGR of 7.3% during review period.

Toxicological testing of cosmetics and daily chemical products refers to the systematic assessment of the potential safety risks to human health posed by the product and its raw materials under normal or foreseeable use conditions, using in vitro tests, computational toxicology, and (under compliant conditions) in vivo or alternative methods, before the product is marketed or during formula changes. The testing focuses on acute and long-term toxicity, skin/eye irritation and corrosivity, skin sensitization, genotoxicity, reproductive and developmental toxicity, and systemic exposure safety assessment (MoS). Its purpose is to provide scientific evidence for product safety conclusions while meeting regulatory compliance requirements, and it is a core safety threshold for cosmetics and daily chemical products to complete filing, registration, and commercial sales.

Toxicological testing of cosmetics and daily chemical products is rapidly shifting from traditional animal experiments to alternative approaches centered on in vitro models, organoids, computational toxicology, and weighted evidence (WoE). This change stems from both the increasingly stringent restrictions on animal testing by regulators in Europe, the US, and China, and the practical needs of brands for R&D efficiency, cost control, and ethical image. Future competitive advantage will no longer depend on the completeness of testing items, but on the ability to develop a systematic safety assessment logic acceptable to regulators with fewer experiments and shorter cycles.

This places higher demands on the methodological capabilities of CROs and testing institutions.

With the increasing proportion of functional ingredients, highly active raw materials, and products for sensitive skin, toxicological testing is no longer just 'required for registration,' but is gradually becoming an important tool for product differentiation and risk control. Companies that can screen high-risk formulations in the early stages of R&D through toxicological prediction and mechanism assessment often have a significant advantage in terms of time-to-market, recall risk, and long-term brand reputation. In the long run, toxicological testing will shift from passive compliance to front-end R&D decision support, becoming a key hub connecting regulations, safety, and commercial success.
