According to our (Global Info Research) latest study, the global Toxicology Testing of Daily Chemical Products and Cosmetics market size was valued at US\$ 2681 million in 2025 and is forecast to a readjusted size of US\$ 4373 million by 2032 with a CAGR of 7.3% during review period.

Toxicological testing of daily chemical products and cosmetics refers to the safety assessment of raw materials or finished products using standardized experimental methods before product launch or during formula changes, to determine whether they pose irritation, sensitization, toxicity, or potential risks to human skin, eyes, or overall health. This testing typically covers acute toxicity, skin irritation and corrosion, eye irritation, skin sensitization, genotoxicity, etc., and employs in vitro substitution methods and risk assessment models to meet regulatory compliance requirements and consumer safety needs. It is a crucial link in the compliant market launch and quality control of daily chemical and cosmetic products.

From a market perspective, toxicological testing for daily chemical products and cosmetics is evolving from a 'compliance cost' for companies to a rigid entry barrier determining whether a product can be launched on the market and sold across regions. As countries continue to refine cosmetic safety regulations, especially regarding raw material safety, efficacy claims, and risk assessments, toxicological testing is no longer simply about 'issuing reports,' but is deeply embedded in product development and registration processes. For brands, testing compliance capabilities directly impact the pace of new product launches and global expansion, significantly increasing the market position of third-party testing institutions with regulatory understanding, testing experience, and data accumulation.

From a supply and technology perspective, restrictions on animal testing and increased consumer ethical awareness are accelerating the transformation of toxicological testing towards in vitro alternative methods and comprehensive risk assessment. This change has not reduced the market size; instead, it has raised the technical threshold and the value of a single project. Companies no longer need to 'conduct a single test,' but rather require the ability to design complete safety assessment strategies, select methodologies, and interpret results. In the future, the core of competition among toxicology testing institutions will shift from 'the number of projects' to 'methodological systems and data credibility.' Service providers that can integrate in vitro testing, historical data, and regulatory logic into systematic solutions are more likely to gain long-term cooperation with mid-to-high-end daily chemical and cosmetic clients.
