According to our (Global Info Research) latest study, the global Track-etched Membrane Filter market size was valued at USD 275.4 million in 2023 and is forecast to a readjusted size of USD 316.6 million by 2030 with a CAGR of 2.0% during review period.

Track-etched membranes have well-defined pore structures and pore size distributions. The pore size and the density of track-etched membranes is independently controlled during the production process. The main manufacturing stage of track-etched membranes is the ion irradiation of the polymer film. During this step, heavy ions are able to penetrate the polymer film, resulting in ionization and excitation of electrons. In the second step of production, the remaining polymer chains are etched using appropriate chemicals to remove small-sized particles through diffusion. The major features of track-etched membranes are well-defined cylindrical geometry of pores, low protein binding, and smooth surface for collection of particles for observation under microscopes.

Global core track-etched membrane manufacturers include GE Healthcare, Merck Millipore etc. The top 3 companies hold a share about 56%. North America is the largest market, with a share about 41%, followed by Europe with the share about 35%.
