Trans-arterial Chemoembolization (TACE) is an interventional radiology procedure that delivers anti-cancer medication (chemotherapy) and embolizing materials directly into blood vessels feeding a malignant liver tumor. TACE is a two-pronged approach that can simultaneously limit the blood supply feeding a tumor in order to destroy cancerous cells (embolization) while the chemotherapy prevents further growth. Transarterial Chemoembolization (TACE) is a minimally invasive procedure in which chemotherapy and embolic agents are directly delivered to a cancerous tumour via its blood supply. The embolic agents are used to cut off the blood supply to the tumour without affecting the rest of the liver. Compared to receiving conventional chemotherapy, TACE allows for the maximum amount of chemotherapy agent to reach the tumour, while limiting the amount released into the bloodstream.
