## Abstracts

The global Transcoding Gateways market size is expected to reach \$ 820 million by 2032, rising at a market growth of 4.4% CAGR during the forecast period (2026-2032). In 2025, global sales of Transcoding Gateways reached approximately 40 k units, with an average market price of about USD 15000 per unit, an annual production capacity of roughly 50 k units, and an industry-average gross margin of approximately 40%.

A Transcoding Gateway is a dedicated video/audio processing gateway appliance or virtual node deployed in operator networks, data centers or cloud environments to perform real-time or offline transcoding and protocol adaptation across different codecs (e.g., H.264, H.265/HEVC, AV1), resolutions, bitrates and transport protocols (e.g., IP multicast, HTTP/ABR, SRT, RTMP). Built on specialized hardware (ASICs, GPUs, FPGAs) or high-performance x86/ARM servers, it integrates transcoding engines, multiplexing/packaging, encryption and session control to provide multi-screen, multi-bitrate and multi-device media gateway capabilities for IPTV/OTT, live and on-demand streaming, unified communications and video surveillance, optimizing bandwidth usage and simplifying network architecture while preserving video quality and latency.

On the upstream side, transcoding gateways depend on general-purpose and specialized silicon (CPUs, GPUs, video codec ASICs/FPGAs), high-density server hardware, network interfaces and switches, operating systems and virtualization layers, and commercial or in-house video transcoding software stacks; some vendors also leverage cloud infrastructure and CDN services as part of the solution. In the midstream, encoding/transcoding solution providers and equipment manufacturers handle system design, appliance integration and software optimization. Downstream, consumption is driven directly by the growth of OTT video, live streaming, IPTV/cable TV, video conferencing and surveillance traffic: video streaming and OTT markets are expanding at roughly 10%-20% CAGR, forcing operators and content platforms to continuously expand or refresh their transcoding gateway fleets to support higher

concurrency, higher resolutions and new codecs. As a result, transcoding gateways exhibit a capacity-driven, recurring procurement pattern closely tied to traffic growth and service expansion.

The transcoding gateways market sits at the heart of the video delivery value chain, enabling operators, OTT platforms, broadcasters and enterprises to transform content into the right formats, bitrates and protocols for any screen. As online video consumption, live streaming and multi-screen viewing continue to grow, operators are shifting from fixed-function hardware appliances toward more flexible architectures that blend high-density hardware, software/virtualized gateways and cloud-based transcoding services, often accelerated by GPUs, ASICs or FPGAs to handle UHD, HDR and new codecs like HEVC and AV1 efficiently. Competition spans traditional broadcast equipment vendors, IP/video specialists and cloud providers, with differentiation increasingly coming from density, power efficiency, support for adaptive bitrate (ABR) workflows, integration with video processing platforms and the use of AI to optimize quality and costs.
