According to our (Global Info Research) latest study, the global Transcranial Magnetic Stimulation (TMS) Devices market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Transcranial Magnetic Stimulation (TMS) Devices are medical devices that generate magnetic field pulses to stimulate brain neuron activity in specific areas of the head. It is a non-invasive treatment that modulates and affects the function of neural networks in the brain.

The TMS device consists of an electromagnetic coil that is placed near the patient's head. The device generates strong magnetic field pulses that penetrate the skull and reach the cerebral cortex. Pulses of magnetic fields can generate electrical currents in targeted areas, activating or inhibiting neuronal activity. By controlling the parameters of stimulation, such as frequency, intensity, and location, the brain's neural circuits can be directionally adjusted.

TMS devices are commonly used to treat neuropsychiatric disorders such as depression, anxiety, and schizophrenia. It is considered a relatively safe and non-invasive treatment option, with fewer side effects than traditional drug treatments. TMS may improve symptoms by modulating activity in brain regions and have long-term effects on the connectivity and function of neural networks.

In addition to clinical treatments, TMS devices are also used in research to explore the mechanisms of brain function, neuroplasticity, and related diseases. It can help

scientists gain insights into how the brain works and provide new ideas and methods for disease treatment and recovery.
