Abstracts

The global Transcranial Magnetic Stimulation (TMS) Devices market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Transcranial Magnetic Stimulation (TMS) Devices are medical devices that generate magnetic field pulses to stimulate brain neuron activity in specific areas of the head. It is a non-invasive treatment that modulates and affects the function of neural networks in the brain.

The TMS device consists of an electromagnetic coil that is placed near the patient's head. The device generates strong magnetic field pulses that penetrate the skull and reach the cerebral cortex. Pulses of magnetic fields can generate electrical currents in targeted areas, activating or inhibiting neuronal activity. By controlling the parameters of stimulation, such as frequency, intensity, and location, the brain's neural circuits can be directionally adjusted.

TMS devices are commonly used to treat neuropsychiatric disorders such as depression, anxiety, and schizophrenia. It is considered a relatively safe and non-invasive treatment option, with fewer side effects than traditional drug treatments. TMS may improve symptoms by modulating activity in brain regions and have long-term effects on the connectivity and function of neural networks.

In addition to clinical treatments, TMS devices are also used in research to explore the mechanisms of brain function, neuroplasticity, and related diseases. It can help scientists gain insights into how the brain works and provide new ideas and methods for

disease treatment and recovery.
